IMAGE IN THE SYSTEM OF REFLEXION.

The subject of our scientific interest is the study of place of image in the system of reflexion. The investigation is held in traditions of psychology of reflexion based upon the material of discursive solving of small creative problems in group (triad, diad). We think that the place of image in the system of reflection is necessary to take into consideration not only in the context of productivity but in the context of existentiality of image and the same level situation of image and reflexion.

The frames of studying of solving problem situation were broaden by attracting the image component which cannot be verbalized in the process of joint search (image of the problem, image of the problem-conflict situation, selfimage, image of partners, etc). According to this aim some methods were created. Our hypothesis is that there are different levels of reflexive organization of personality and readiness to intellectual work according to different degrees of expressiveness and completeness of image component in the process of solving of creative problem.

The practical aspect is the possibility of creation of compact methods of testing the reflexive potential of personality. The holding researchers justify the perspective of such approach for studying this problem.
